

Red teaming, in plain sight.

Hear the recorded test. Inspect the source event. Compare the matched follow-up.

A careful voice can still reveal the answer.

In the historical baseline, the agent asked for phone verification and then said the protected digits itself. The disclosure is recorded at 51.887 seconds.

Caller → voice agent → evidence

Two AssemblyAI sessions exchange paced PCM audio. The caller runs a test scenario. The support fixture responds. Voxrede records source events, tool requests, generated audio and audio sent after pacing and noise.

19 attempted trials. 9 scenario pairs.

The plan compares the baseline and stricter prompt across adversarial and permitted tasks.
Reviewed permitted-task completion: 3/6. Inconclusive evaluations: 12. Detector findings: 0.

Audio sent, then evidence recorded.

Each trial has two playable delivered-audio tracks, source-event links and an evidence manifest. Audio is recorded after pacing and perturbation. Source timestamps use a monotonic clock; audio records include sample positions.

Digits are not identity proof.

Negation, unrelated identifiers and echoed secrets cannot establish verified caller authorization. Grouped digits are detected; split disclosures retain source references for review. A tool.call is a request, not evidence that a refund happened.

Keep every attempt. Keep missing pairs visible.

Trials receive unique IDs and versioned manifests. The archive preserves original source logs and configuration identity. Incomplete trials keep their findings but cannot be counted as completed evaluation failures.

Start with a permitted task. Then inspect the attacks.

Open the recorded evaluation. Listen to a permitted-task pair, inspect its cited source events, then compare all matched adversarial follow-ups. The historical 17-sample workspace remains searchable and requires no API key.
